TekTone® Sales Support Bulletin - No. 6

**Two items: 1) a new part number and
2) a new product enhancement**

Part Numbers involved: NC375 (reference SSB No. 5) and TE903A/905A

1. In SSB No. 5, we introduced the new feature of field programming for the NC375 voltage interface which is used to add radio pocket paging to TekTone's hard wired nurse call systems. The NC375 is now being shipped with the software to do the architectural room number programming, which previously had to be done at the factory.

The option for the factory to do this is still available and a new part number has been generated to accommodate this request. If you desire the programming to be done at the factory, please use part number LS375CM at a list price of \$3.00 for each point. You will need to supply the facility name and address as always and a list showing the selector point number and architectural room number for that point.

- 2) We welcome input from the field and whenever possible try to implement these ideas to enhance TekTone's product. We received the following from an installer and while it is a small item, will possibly save time in the long run. A 12" no-flip plug-to-plug phone cable has been added to the TE903A and TE905A package. The installer said, they would go to the job and install the unit but have to hunt about for a store to get a cable to connect the unit to the RJ11 jack installed by the phone company. Including a simple cable would save him a lot of time and effort.

As always, please call us with any questions.
